EXECUTIVE SUMMARY

Integrated Business Intelligence Analysis: End-to-End Business Data Analysis

Project Background

Organizations generate large volumes of operational data but often lack structured analysis to convert data into actionable decisions. This capstone project applies data analytics techniques to evaluate business performance across three domains: sales operations, customer retention, and housing market pricing.

The objective was to conduct an end-to-end business analysis workflow, transforming raw datasets into meaningful insights and strategic recommendations.

Project Objectives

The primary goals of this project were:

- To analyze sales performance and revenue distribution
- To understand factors influencing customer churn
- To evaluate housing market pricing patterns
- To develop data-driven business insights
- To demonstrate a reproducible analytics workflow

Data Overview

The analysis used three datasets containing more than **900 total records**:

- Sales transaction dataset (100 records)
- Housing price dataset (300 records)
- Customer churn dataset (500 records)

Data preparation included validation, cleaning, formatting corrections, and feature engineering to ensure analytical accuracy.

Methodology

The project followed a structured analytics pipeline:

1. Data Cleaning and Preparation
2. Exploratory Data Analysis (EDA)
3. Statistical and Comparative Analysis
4. Visualization and Pattern Identification

5. Business Insight Generation

Python, Pandas, and Matplotlib were used to perform analysis and visualization.

Key Findings

Sales Analysis

- Revenue was concentrated within mid-value transactions.
- Regional differences influenced overall sales performance.

Customer Churn Analysis

- Overall churn rate was relatively low (~10%).
- Contract type and customer tenure significantly affected retention behavior.

Housing Market Analysis

- Property area showed a strong relationship with pricing.
- Market activity was concentrated within mid-price property segments.

Business Recommendations

Based on analytical findings, the following strategies are recommended:

- Focus marketing investments on high-performing regions.
- Introduce loyalty programs to improve long-term customer retention.
- Encourage longer-term subscription contracts to reduce churn.
- Implement data-driven pricing strategies for property valuation.

Business Impact

Implementing these recommendations can help organizations:

- Improve revenue optimization
- Reduce customer attrition
- Enhance pricing decision accuracy
- Support data-driven strategic planning

Conclusion

This project demonstrates how structured data analytics can convert raw business data into actionable intelligence. The end-to-end workflow highlights practical applications of data analysis in solving real-world business problems while ensuring reproducibility and professional documentation standards.
